H777 / FIELD NOTE 11 / TURNFLOW HOME

The auto-fix wanted to downgrade storage.

A documentation push triggered a failing security audit. The recorded forced fix would downgrade **@vercel/blob to 2.4.0**.

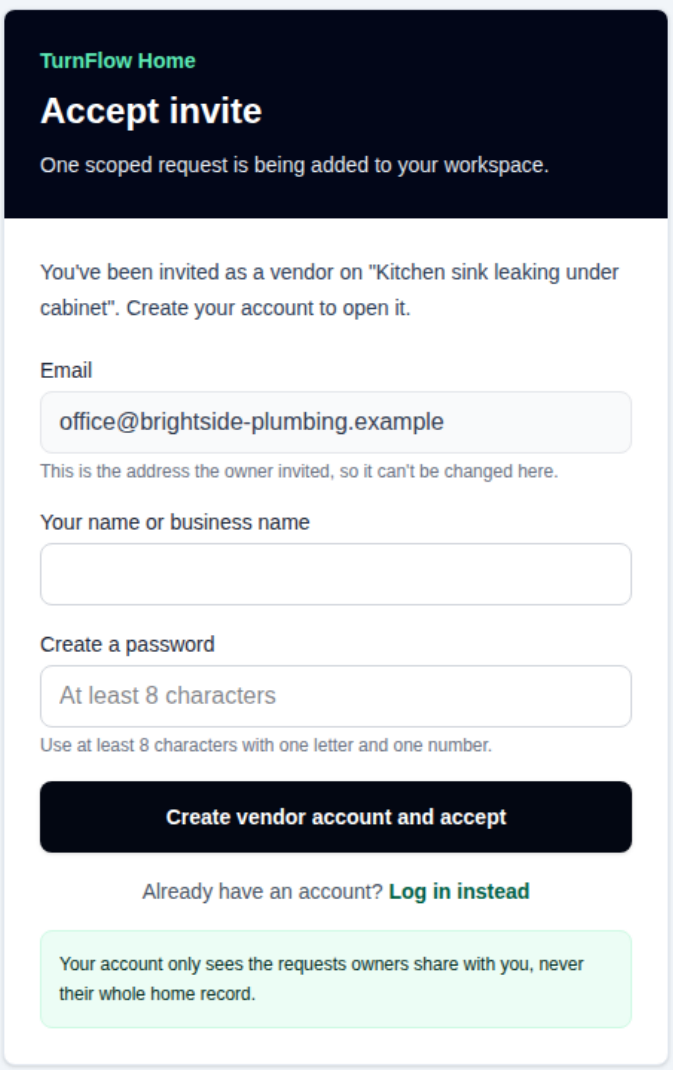

ACTUAL PACKAGE DIFF · ec4bb76 · EXCERPT

```
-    "next": "16.3.8",
+    "next": "16.4.3",
-    "zod": "^4.4.3"
+    "zod": "^4.6.6"
-    "eslint-config-next": "16.3.8",
+    "eslint-config-next": "16.4.3",
+  },
+  "overrides": {
+    "zod": "$zod"
```

> **The chosen fix:** patch targeted dependencies and override the nested zod version. Avoid the suggested storage downgrade.

This shows the fix that shipped—not a screenshot of the original audit warning. A downgrade was not applied here.

An invitation defines the access. Not the form.

Email is displayed read-only. There is no role selector.
The server reads identity and role from the invitation record.

Original repository screenshot with synthetic demo data.

H777 / FIELD NOTE 11 / TURNFLOW HOME

Two clicks.
One successful claim.

The database accepts the claim only while the invitation is pending.

ACTUAL SOURCE EXCERPT · lib/actions/invites.ts

```
  const claimed = await db
    .update(invites)
    .set({ status: "accepted", acceptedById: userId, acceptedAt })
    .where(and(eq(invites.id, invite.id), eq(invites.status, "pending")))
    .returning({ id: invites.id });
  if (claimed.length === 0) {
    return { error: INVITE_PROBLEM_MESSAGES.used };
  }
```

RECORDED VERIFICATION · DEPENDENCY REPAIR

```
- Clean `rm -rf node_modules && npm ci` from the new lockfile (the same
way CI installs).
- `npm run verify` passed: lint, typecheck, 35 files / 331 tests,
production
  audit **0 vulnerabilities**, no schema drift, production build on
Next 16.4.3.
```

These are historical build-log results, not fresh test output. The conditional claim is atomic; the full signup sequence is not one transaction.

> **Control the perimeter.**
> Review the change. Verify the boundary. Test the result.
